

Dairy co-products that provide alternative sources of protein

Archer Daniels Midland Company is a leading processor of grains and oilseeds in the United States and abroad. From this processing comes a wide variety of co-products which ADM Animal Nutrition™ uses to provide alternative sources of protein, energy, fiber, carbohydrates, minerals, and vitamins for feeding to livestock.

One of our goals at ADM Animal Nutrition, through extensive research and practical application, is to add value to these co-products -- value for our livestock producer customers. Many co-products are currently utilized in ADM Animal Nutrition products and are also used by our customers as commodities in livestock rations.

Co-products utilized in ADM Animal Nutrition's product lines are research tested. Before a co-product is used in an ADM Animal Nutrition product, it must demonstrate a product performance advantage and not contribute to a price increase in the finished product. Sometimes the inclusion of a co-product has actually decreased finished product cost.

ADM Animal Nutrition also continues to evaluate the use of co-products, such as distillers grain, corn gluten feed, condensed fermented corn extractives, and others, in livestock diets on an on-going basis. At ADM Animal Nutrition, we strive through our research and knowledge base to be your "Experts in Co-Product Feeding."
